Test 2: Oct 28

Course project:  
will be released and introduced in the lecture of next week.

# Summary of some NPc problems

# Basic reduction strategies.

---

- Reduction by simple equivalence.
  - $\text{INDEPENDENT-SET} \equiv_p \text{VERTEX-COVER}$
  - $\text{VERTEX COVER} \equiv_p \text{CLIQUE}$
- Reduction from special case to general case
  - $\text{VERTEX-COVER} \leq_p \text{SET-COVER}$
- Reduction from general case to special case
  - $\text{SAT} \leq_p \text{3-SAT}$
- Reduction by encoding with gadgets
  - $\text{3-SAT} \leq_p \text{INDEPENDENT-SET}$

## Vertex cover (VC)

- given a graph  $G=(V,E)$ , find the *smallest* number of vertices that cover *each edge*
- Decision problem: is there a set of at most  $K$  vertices that cover *each edge*?

vertex cover of size 3

vertex cover of size 2

# Vertex Cover Decision Problem

- $VC(G,k)$ : Given a graph  $G$  and an integer  $K$ , does  $G$  have a vertex cover of size at most  $K$ ?
- **Theorem: VC is NP-complete.**
- Proof:
  - 1) show VC is in NP:
    - **Certificate**: a subset  $V'$  of the vertices
    - **Certifier**: check in polynomial time  $O(n+m)$  if  $|V'| \leq K$  and if every edge has at least one endpoint in  $V'$ .  
How?

vertex cover in  $G$  of size  $k$

independent set in  $G'=G$  of size  
 $k' = |V| - k$

# Vertex Cover and Independent Set [KT 8.1]

- **Claim.** We show a set of vertices  $S$  is an independent set of  $G$  iff  $V - S$  is a vertex cover of  $G$ .
- $\Rightarrow$ 
  - Let  $S$  be any independent set.
  - Consider an arbitrary edge  $(u, v)$ .
  - $S$  independent  $\Rightarrow u \notin S$  or  $v \notin S \Rightarrow u \in V - S$  or  $v \in V - S$ .
  - Thus,  $V - S$  covers any edge  $(u, v)$ .  $V - S$  is a vertex cover.
- $\Leftarrow$ 
  - Let  $V - S$  be any vertex cover.
  - Consider any two nodes  $u \in S$  and  $v \in S$ .
  - Observe that  $(u, v) \notin E$  since  $V - S$  is a vertex cover and would have needed to cover edge  $(u, v)$  by including one of its endpoints.
  - Thus, no two nodes in  $S$  are joined by an edge  $\Rightarrow S$  independent set. ▪

**Claim.** Solving  $IS(G, k)$  is equivalent to solving  $VC(G, n-k)$  and hence  
 $VC \leq_p IS$  and  $IS \leq_p VC$ .

# Vertex Cover is NP-complete

---

- Independent set:  $IS(G,k)$ 
  - given a graph  $G=(V,E)$ , find the largest independent set: a set of vertices in the graph with **no edges between them**.
  - Decision version: is there an independent set of at least  $k$  vertices?
- Vertex Cover:  $VC(G,k)$ 
  - Given a graph  $G$  and an integer  $k$ , does  $G$  have a vertex cover of size at most  $K$ ?
- VC is NP-complete because we showed:
  - VC is NP
  - IS is NP-complete and  $IS \leq_p VC$ , hence VC is NP-complete
  - (Given  $IS(G,k)$ , reduce it solving  $VC(G'=G, k'=|V|-k)$ , correctness by proof on previous slide)

# 3SAT reduces to Vertex Cover

- Vertex cover (VC)
- Given a graph  $G=(V,E)$  and an integer  $K$ , is there a set of at most  $K$  vertices that cover *each edge*?
  - By gadget (similar to 3SAT to IS)

3SAT

Vertex Cover  
of size  $K = l + 2m$ 

Variable gadgets

 $l$ : # variables  
 $m$ : # clauses

Clause gadgets

# CLIQUE vs. VC (simple equivalence)

- **CLIQUE** ( $G, k$ ): does  $G$  contain a completely connected subgraph of size at least  $K$ ?
- The **complement** of graph  $G = (V, E)$  is the graph  $G_c = (V, E_c)$ , where  $E_c$  consists of all the edges that are missing in  $G$ .
- $\text{CLIQUE}(G, k)$  equivalent to  $\text{VC}(G_c, n-k)$

# CLIQUE vs. VC

- Theorem:**  $V'$  is a **clique** of  $G$  if and only if  $V - V'$  is a **vertex cover** of  $G_c$ .

the vertices in  $V'$  would only "cover" missing edges and thus are not needed in  $G_c$

# CLIQUE vs. VC

- Theorem:**  $V'$  is a **clique** of  $G$  if and only if  $V - V'$  is a **vertex cover** of  $G_c$ .

the vertices in  $V'$  would only "cover" missing edges and thus are not needed in  $G_c$

# CLIQUE vs. VC

---

**Theorem:**  $S$  is a **clique** of  $G$  if and only if  $V-S$  is a **vertex cover** of  $G_c$ .

( $\Rightarrow$ )  $G$  has a clique  $S$ . To show:  $V-S$  is a VC for  $G_c$

Let's assume for the sake of contradiction  $V-S$  is not VC for  $G_c$

Let  $e'=(u, v)$  be any edge in  $E_c$  that is not covered by  $V-S$  (such edge must exist if  $V-S$  is not VC)

**Theorem:**  $S$  is a **clique** of  $G$  if and only if  $V-S$  is a **vertex cover** of  $G_c$ .

( $\Rightarrow$ )  $G$  has a clique  $S$ . To show:  $V-S$  is a VC for  $G_c$

Let's assume for the sake of contradiction  $V-S$  is not VC for  $G_c$

Let  $e'=(u, v)$  be any edge in  $E_c$  that is not covered by  $V-S$  (such edge must exist if  $V-S$  is not VC)

- $\Rightarrow$  Both  $u$  not in  $V-S$ , and  $v$  not in  $V-S$  (by definition of not “covered” for edge  $(u, v)$ )
- $\Rightarrow$   $u$  in  $S$  and  $v$  in  $S$ , but we also know that  $S$  is a clique in  $G$
- $\Rightarrow$  there must be an edge  $(u, v)$  in  $G$ , and hence  $e'=(u, v)$  is in  $E$

If  $e'$  is in  $E$ , it cannot be in  $E_c$ , contradiction.

So  $V-S$  must be a VC for  $G_c$

# CLIQUE vs. VC

---

**Theorem:**  $S$  is a **clique** of  $G$  if and only if  $V-S$  is a **vertex cover** of  $G_c$ .

( $\Leftarrow$ )  $V-S$  is a VC for  $G_c$ . To show:  $S$  is a clique in  $G$

Let's assume for the sake of contradiction that  $S$  is not a clique in  $G$  (i.e., there must be at least one edge missing among  $S$ )

# CLIQUE vs. VC

**Theorem:**  $S$  is a **clique** of  $G$  if and only if  $V-S$  is a **vertex cover** of  $G_c$ .

( $\Leftarrow$ )  $V-S$  is a VC for  $G_c$ . To show:  $S$  is a clique in  $G$

Let's assume for the sake of contradiction that  $S$  is not a clique in  $G$  (i.e., there must be at least one edge missing among  $S$ )

- $\Rightarrow$  Exist 2 nodes  $u, v$  in  $S$  such that edge  $(u, v)$  is not in  $E$
- $\Rightarrow$  edge  $(u, v)$  must be in  $E_c$  ( by definition of complement)
- $\Rightarrow$  but neither  $u$  nor  $v$  are in  $V-S$ , so edge  $(u, v)$  is not covered by  $V-S$ , contradiction with  $V-S$  being a VC for  $G_c$

So  $S$  must be a clique in  $G$ . ■

# VC and CLIQUE

---

- Can use previous observation to show that
  - $VC \leq_p CLIQUE$  (given  $VC(G, k)$ , solve  $CLIQUE(G'=G_c, k'=|V|-k)$ )
- and also to show that
  - $CLIQUE \leq_p VC$  (given  $CLIQUE(G, k)$ , solve  $VC'(G'=G_c, k'=|V|-k)$ )
- How about  $IS \leq_p CLIQUE$  and  $CLIQUE \leq_p IS$ ?
  - simple equivalence as well

# Genres of NP-complete problems

---

- Six basic genres of NP-complete problems and paradigmatic examples.
  - Packing problems: SET-PACKING, INDEPENDENT SET.
  - Covering problems: SET-COVER, VERTEX-COVER.
  - Constraint satisfaction problems: SAT, 3-SAT.
  - Sequencing problems: HAMILTONIAN-CYCLE, TSP.
  - Partitioning problems: 3-COLOR, 3D-MATCHING.
  - Numerical problems: 2-PARTITION, SUBSET-SUM, KNAPSACK.

SUBSET-SUM. Given natural numbers  $w_1, \dots, w_n$  and an integer  $W$ , is there a subset that adds up to exactly  $W$ ?

Ex:  $\{ 1, 4, 16, 64, 256, 1040, 1041, 1093, 1284, 1344 \}$ ,  $W = 3754$ .

Yes.  $1 + 16 + 64 + 256 + 1040 + 1093 + 1284 = 3754$ .

Claim.  $3\text{-SAT} \leq_p \text{SUBSET-SUM}$ .

# Subset Sum

Construction. Given 3-SAT instance  $\Phi$  with  $n$  variables and  $k$  clauses, form  $2n + 2k$  decimal integers, each of  $n+k$  digits, as illustrated below.

Claim.  $\Phi$  is satisfiable iff there exists a subset that sums to  $W$ .

Pf. No carries possible.

$$C_1 = \bar{x} \vee y \vee z$$

$$C_2 = x \vee \bar{y} \vee z$$

$$C_3 = \bar{x} \vee \bar{y} \vee \bar{z}$$

2k dummies to get clause  
columns to sum to 4

	x	y	z	$C_1$	$C_2$	$C_3$	
x	1	0	0	0	1	0	100,010
$\neg x$	1	0	0	1	0	1	100,101
y	0	1	0	1	0	0	10,100
$\neg y$	0	1	0	0	1	1	10,011
z	0	0	1	1	1	0	1,110
$\neg z$	0	0	1	0	0	1	1,001
}	0	0	0	1	0	0	100
	0	0	0	2	0	0	200
	0	0	0	0	1	0	10
	0	0	0	0	2	0	20
	0	0	0	0	0	1	1
	0	0	0	0	0	2	2
	0	0	0	0	0	2	2
W	1	1	1	4	4	4	111,444

# Knapsack Problem

Knapsack problem.

- Given  $n$  objects and a "knapsack."
- Item  $i$  has value  $v_i > 0$  and weighs  $w_i > 0$ .  $\leftarrow$  we'll assume  $w_i \leq W$
- Knapsack can carry weight up to  $W$ .
- Goal: fill knapsack so as to maximize total value.

Ex:  $\{3, 4\}$  has value 40.

$W = 11$

Item	Value	Weight
1	1	1
2	6	2
3	18	5
4	22	6
5	28	7

(Decision) **KNAPSACK**: Given a finite set  $X$ , nonnegative weights  $w_i$ , nonnegative values  $v_i$ , a weight limit  $W$ , and a target value  $V$ , is there a subset  $S \subseteq X$  such that:

$$\begin{aligned}\sum_{i \in S} w_i &\leq W \\ \sum_{i \in S} v_i &\geq V\end{aligned}$$

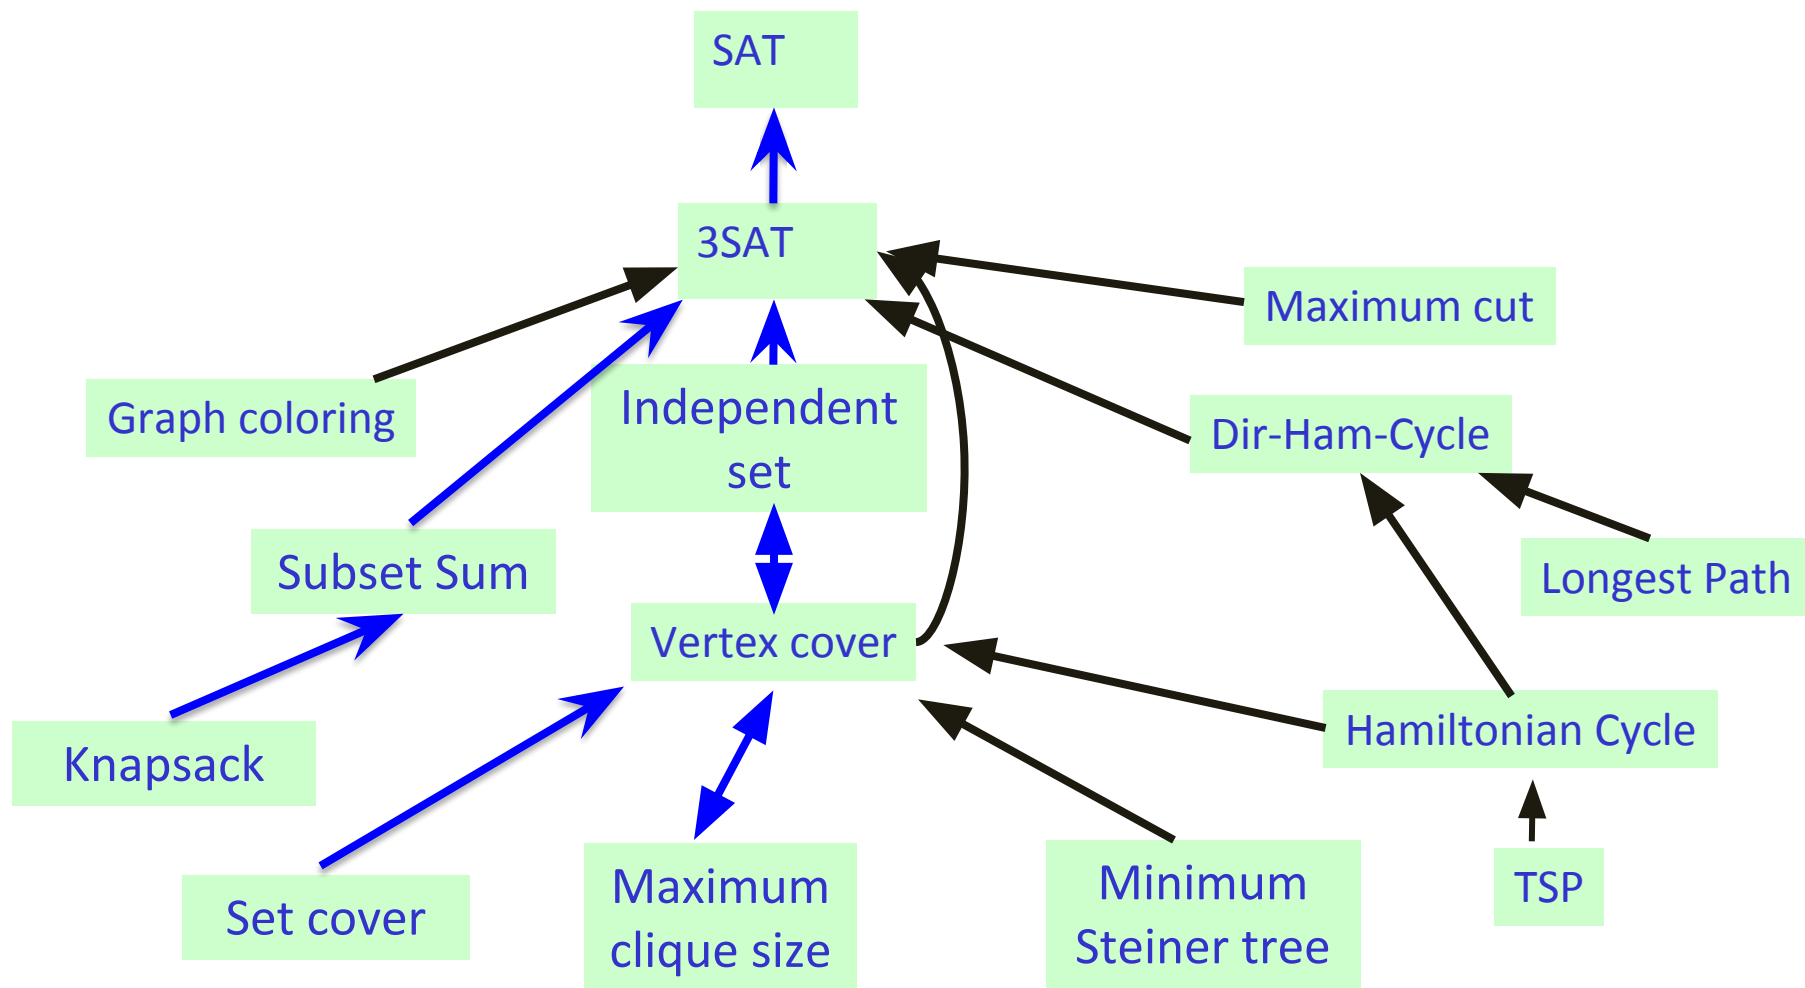

**SUBSET-SUM**: Given a finite set  $Y$ , nonnegative values  $u_i$ , and an integer  $U$ , is there a subset  $S' \subseteq Y$  whose elements sum to exactly  $U$ ?

Claim. **SUBSET-SUM**  $\leq_p$  **KNAPSACK**.

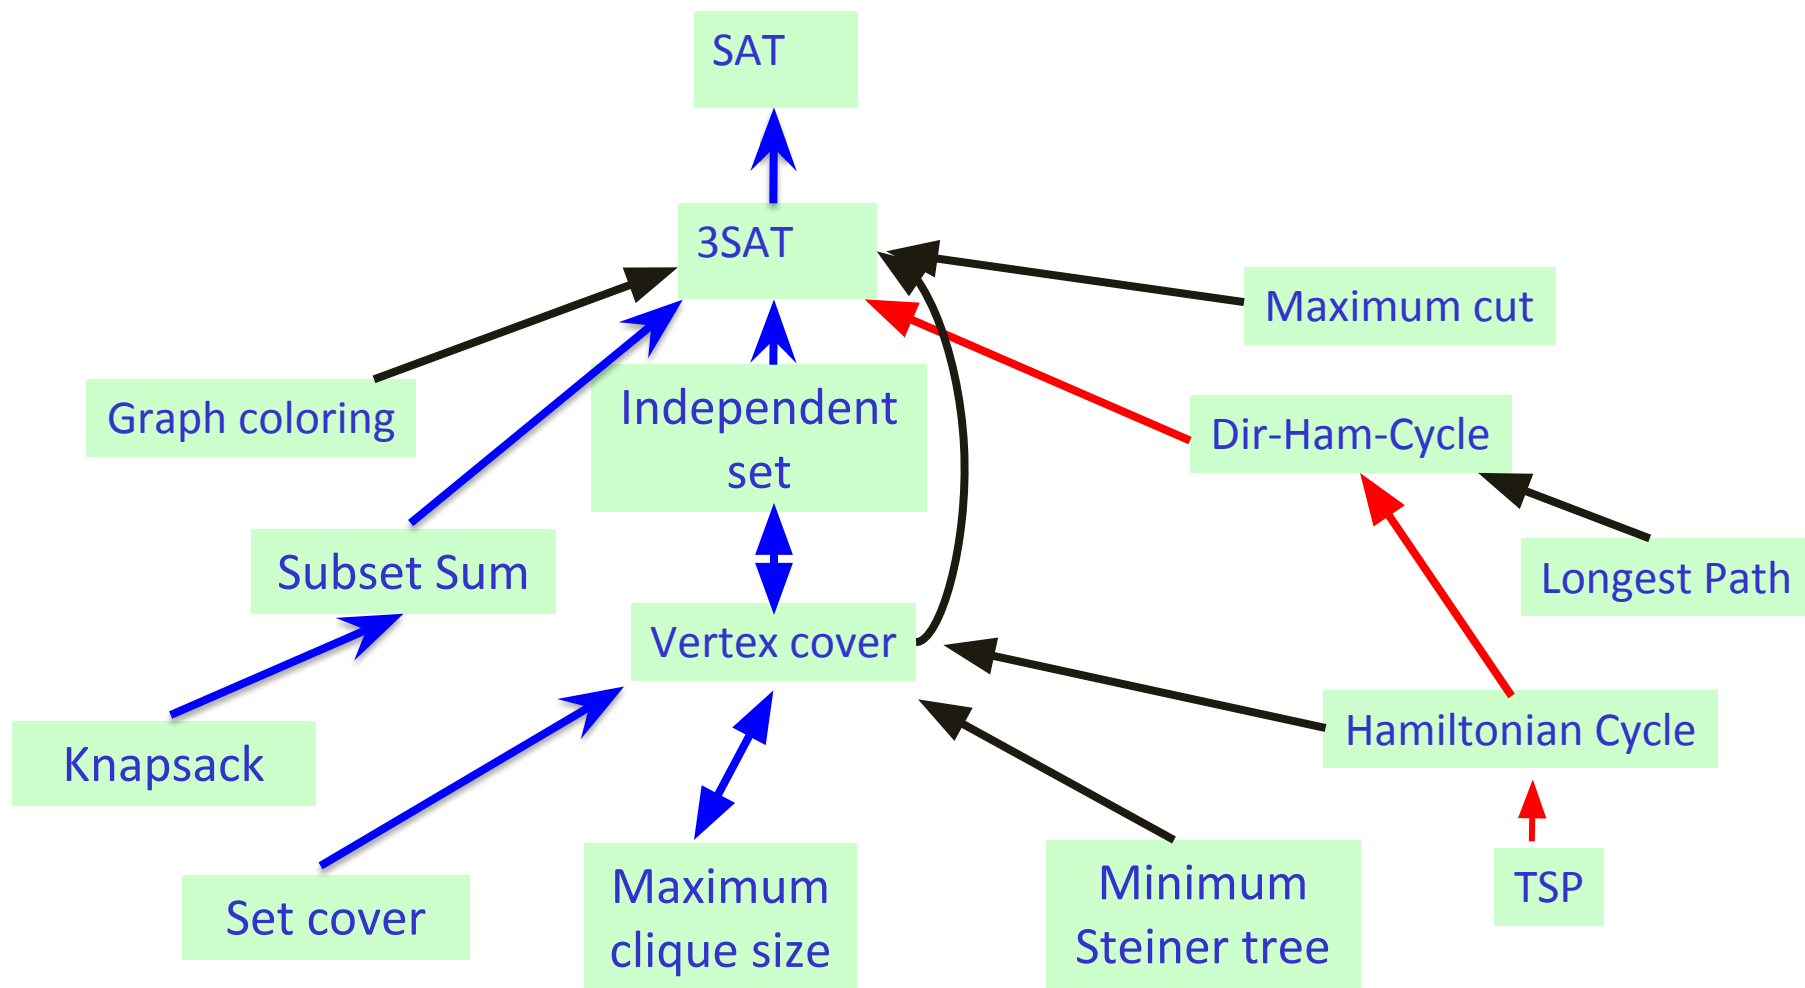

Reduction. Given instance  $(u_1, \dots, u_n, U)$  of **SUBSET-SUM**, create **KNAPSACK** instance:

$$\begin{aligned}v_i = w_i = u_i \quad \sum_{i \in S} u_i &\leq U \\ V = W = U \quad \sum_{i \in S} u_i &\geq U\end{aligned}$$

# Summary of some NPc problems

# Summary of some NPc problems

# Genres of NP-complete problems

---

- Six basic genres of NP-complete problems and paradigmatic examples.
  - Packing problems: SET-PACKING, INDEPENDENT SET.
  - Covering problems: SET-COVER, VERTEX-COVER.
  - Constraint satisfaction problems: SAT, 3-SAT.
  - Sequencing problems: HAMILTONIAN-CYCLE, TSP.
  - Partitioning problems: 3-COLOR, 3D-MATCHING.
  - Numerical problems: 2-PARTITION, SUBSET-SUM, KNAPSACK.

# Hamiltonian Cycle

- HAM-CYCLE: given an undirected graph  $G = (V, E)$ , does there exist a simple cycle  $\Gamma$  that contains every node in  $V$ .

YES: vertices and faces of a dodecahedron.

# Hamiltonian Cycle

- HAM-CYCLE: given an undirected graph  $G = (V, E)$ , does there exist a simple cycle  $\Gamma$  that contains every node in  $V$ .

NO: bipartite graph with odd number of nodes.

# Directed Hamiltonian Cycle

---

- DIR-HAM-CYCLE: given a **digraph**  $G = (V, E)$ , does there exist a simple directed cycle  $\Gamma$  that contains every node in  $V$ ?
- HAM-CYCLE: given an undirected **graph**  $G = (V, E)$ , does there exist a simple directed cycle  $\Gamma$  that contains every node in  $V$ ?
- DIR-HAM-CYCLE (HAM-CYCLE) is in NP
  - **Certificate**: Sequence of vertices
  - **Certifier**: Check if every vertex (except the first) appears exactly once, and that consecutive vertices are connected by a directed (undirected) edge

# 3-SAT Reduces to Dir. Hamiltonian Cycle

---

- Claim.  $3\text{-SAT} \leq_p \text{DIR-HAM-CYCLE}$ .
- Pf. Given an instance  $\Phi$  of  $3\text{-SAT}$ , we construct an instance of  $\text{DIR-HAM-CYCLE}$  that has a Hamiltonian cycle iff  $\Phi$  is satisfiable.
- See [KT 8.5].

# Directed Hamiltonian Cycle

- DIR-HAM-CYCLE: given a **digraph**  $G = (V, E)$ , does there exist a simple directed cycle  $\Gamma$  that contains every node in  $V$ ?
- Claim.  $\text{DIR-HAM-CYCLE} \leq_p \text{HAM-CYCLE}$ .
- Pf. Given a directed graph  $G = (V, E)$ , construct an undirected graph  $G'$  with  $3n$  nodes.

G

G'

# Directed Hamiltonian Cycle

- Claim.  $G$  has a Hamiltonian cycle **iff**  $G'$  does.
- Pf.  $\Rightarrow$ 
  - Suppose  $G$  has a directed Hamiltonian cycle  $\Gamma$ .
  - Then  $G'$  has an undirected Hamiltonian cycle (same order).
- Pf.  $\Leftarrow$ 
  - Suppose  $G'$  has an undirected Hamiltonian cycle  $\Gamma'$ .
  - $\Gamma'$  must visit nodes in  $G'$  using one of following two orders:
    - ..., B, G, R, B, G, R, B, G, R, B, ...
    - ..., B, R, G, B, R, G, B, R, G, B, ...
  - Blue nodes in  $\Gamma'$  make up directed Hamiltonian cycle  $\Gamma$  in  $G$ , or reverse of one. ▪

# Traveling Salesperson Problem

---

- TSP. Given a set of  $n$  cities and a pairwise distance function  $d(u, v)$ , is there a tour of length  $\leq D$ ?

All 13,509 cities in US with a population of at least 500  
Reference: <http://www.math.uwaterloo.ca/tsp/>

# Traveling Salesperson Problem

- TSP. Given a set of  $n$  cities and a pairwise distance function  $d(u, v)$ , is there a tour of length  $\leq D$ ?

Optimal TSP tour

Reference: <http://www.math.uwaterloo.ca/tsp/>

# Traveling Salesperson Problem

- TSP. Given a set of  $n$  cities and a pairwise distance function  $d(u, v)$ , is there a tour of length  $\leq D$ ?

11,849 holes to drill in a programmed logic array  
Reference: <http://www.math.uwaterloo.ca/tsp/>

# Traveling Salesperson Problem

- TSP. Given a set of  $n$  cities and a pairwise distance function  $d(u, v)$ , is there a tour of length  $\leq D$ ?

Optimal TSP tour

Reference: <http://www.math.uwaterloo.ca/tsp/>

# Traveling Salesman Problem

- TSP. Given a set of  $n$  cities and a pairwise distance function  $d(u, v)$ , is there a tour of length  $\leq D$ ?
- HAM-CYCLE: given a graph  $G = (V, E)$ , does there exist a simple cycle that contains every node in  $V$ .

- Claim.  $\text{HAM-CYCLE} \leq_p \text{TSP}$ .

- Pf.

- Given instance  $G = (V, E)$  of HAM-CYCLE, create  $n$  cities with distance function

$$d(u, v) = \begin{cases} 1 & \text{if } (u, v) \in E \\ 2 & \text{if } (u, v) \notin E \end{cases}$$

- $G$  is Hamiltonian iff TSP instance has tour of length  $\leq D=n$ . (proof is omitted)▪
  - Remark. TSP instance in reduction satisfies  $\Delta$ -inequality.
